

ORACLE SIEBEL CRM PUBLIC SECTOR RULE MATRIX

Functional Design Specification: Derived Liability & Enforcement Assessment Calculations

Document Reference: FS-SIEBEL-PS-OGM-020	Effective Date: 06 October 2025
Base Operational Model: OGM Rule Architecture	Rounding Convention: Standard Currency (2 Decimals)

1. EXECUTIVE SUMMARY & CORE ENGINEERING BASELINE

This functional specifications document establishes twenty (20) explicit financial, enforcement, and assessment calculation formulas scaled natively from the baseline template of the core operational rule framework:

$$OGM = (Daily\ Liability \times Number\ of\ Days) / Number\ of\ Periods$$

Per structural architecture standards, variables denoting financial values must resolve to floating-point primitives rounded to two decimal positions at compilation execution boundaries. These derived formulas govern automated rule configurations within public sector case object evaluations, tracking arrears, fee structures, collection adjustments, and benefit clawbacks.

2. DERIVED FORMULA SPECIFICATION MATRIX (1–20)

The following structural sections outline the architectural definitions, input configurations, and exact arithmetic representations for each derived public sector evaluation sub-module.

Formula 01: Extended Non-Resident Parent Arrears Matrix (ENPAM)

Establishes aggregate long-term debt liabilities when a target case transitions through distinct enforcement periods.

$$ENPAM = (Base\ Daily\ Arrears \times Total\ Days\ Delinquent) / Assessment\ Cycles$$

Formula 02: Standard Maintenance Clawback Assessment (SMCA)

Evaluates public benefit overpayments that must be recaptured dynamically relative to income verification boundaries.

$$SMCA = (Daily\ Overpayment\ Threshold \times Non-Compliance\ Windows) / Operational\ Alignment\ Blocks$$

Formula 03: Escalated Enforcement Collection Premium (EECP)

Calculates the additional premium collection charges levied on non-resident accounts due for immediate field team deployment.

$$EECP = (Daily\ Field\ Levy \times Active\ Tracking\ Window) / Enforcement\ Tier\ Index$$

Formula 04: Backdated Legal Liability Reconciliation (BLLR)

Reconciles historical court orders where past maintenance mandates were systemically underpaid across varying tracking steps.

$$BLLR = (Daily\ Valuation\ Variance \times Historical\ Term\ Count) / Statutory\ Settlement\ Windows$$

Formula 05: Pro-Rata Public Sector Service Surcharge (PPSS)

Evaluates handling charges assigned to high-value enforcement cases requiring multi-agency automated data sweeps.

$$PPSS = (Daily\ Processing\ Cost \times Tracking\ Run\ Duration) / Active\ Interface\ Batches$$

Formula 06: Managed Promise-to-Pay Default Penalty (PPDP)

Computes statutory financial penalties when an obligor breaches an agreed active repayment layout window.

$$PPDP = (Daily\ Breach\ Fine \times Days\ Since\ Expiry) / Scheduled\ Installment\ Count$$

Formula 07: Dynamic Income Variation Assessment Fee (DIVA)

Calculates administrative reconciliation costs when self-employed earnings metrics drop below active assessment baselines.

$$DIVA = (Daily\ Tracking\ Surcharge \times Audit\ Window\ Days) / Reporting\ Assessment\ Blocks$$

Formula 08: Inter-Agency Asset Intercept Fine (IAAI)

Governs processing levies during bank account lien executions or direct earning deduction order setups.

$$IAAI = (Daily\ Intercept\ Cost \times Asset\ Isolation\ Period) / Enforcement\ Run\ Quantum$$

Formula 09: Mitigated Care Provider Credit Allocation (CPCA)

Determines offsetting credits granted to primary guardians during temporary split-custody scheduling adjustments.

$$CPCA = (Daily\ Care\ Credit\ Rate \times Eligible\ Co-Parenting\ Days) / Allocation\ Schedule\ Intervals$$

Formula 10: Special Circumstance Hardship Abatement Metric (SCHAM)

Calculates temporary reductions in active maintenance burdens due to short-term verified medical incapacitation blocks.

$$SCHAM = (Daily\ Relief\ Factor \times Certified\ Injury\ Days) / Active\ Payment\ Schedules$$

Formula 11: Foreign Exchange Asset Remittance Charge (FEARC)

Applies systematic processing charges to cross-border enforcement collections requiring central statutory conversion sweeps.

$$FEARC = (Daily\ Conversion\ Overhead \times Clearing\ Window\ Count) / Cross-Border\ Remittance\ Terms$$

Formula 12: Automated Case Re-Registration Levy (ACRL)

Tracks standard processing costs allocated when multi-child cases undergo strategic realignment across jurisdictions.

$$ACRL = (Daily\ Processing\ Overhead \times Readjustment\ Window) / Validation\ Check\ Blocks$$

Formula 13: Delayed Disclosure Compounding Interest (DDCI)

Levies punitive interest compounding constraints when a target entity fails to declare changes to net corporate capital streams.

$$DDCI = (Daily\ Punitive\ Penalty \times Non-Disclosure\ Days) / Formal\ Reporting\ Intervals$$

Formula 14: Employer Deduction Order Admin Surcharge (EDAS)

Computes statutory processing costs reimbursable to payroll departments processing manual earning attachment runs.

$$EDAS = (Daily\ Payroll\ Handling\ Surcharge \times Execution\ Span\ Days) / Active\ Pay\ Cycles$$

Formula 15: Closed-Case Residual Liability Assessment (CRLA)

Manages retrospective processing computations applied to historic files tracking unliquidated state-owed debt balances.

$$CRLA = (Daily\ Archive\ Maintenance\ Unit \times Retention\ Tracking\ Span) / Statutory\ Review\ Cycles$$

Formula 16: Multi-Case Consolidation Credit Matrix (MCCM)

Applies administrative discounts when an obligor maintains synchronous payment pipelines across multiple distinct families.

$$MCCM = (Daily\ Consolidation\ Credit \times Overlapping\ Case\ Days) / Active\ Client\ Accounts$$

Formula 17: Complex Capital Asset Yield Adjustment (CCYA)

Imputes supplementary ongoing liability tiers based on evaluated investment portfolios, property returns, and land yields.

$$CCYA = (Daily\ Imputed\ Asset\ Revenue \times Financial\ Year\ Run) / Capital\ Assessment\ Waves$$

Formula 18: Retroactive Paternity Verification Recovery Token (PVRT)

Handles system credit generation and financial clawbacks following court-validated child liability rescission orders.

$$PVRT = (Daily\ Restitution\ Rate \times Erroneous\ Payment\ Window) / Reconciliation\ Eras$$

Formula 19: Higher-Tier Education Expense Liability Surcharge (HELS)

Adds automated statutory cost supplements to core liability profiles when a child registers for certified university tracks.

$$HELS = (Daily\ Academic\ Support\ Factor \times Semester\ Tracking\ Term) / Institutional\ Billing\ Blocks$$

Formula 20: System-Wide Batch Reconciliation Adjustment (SBRA)

Acts as an automated system balancing calculation to distribute truncation rounding remainders across large operational sets.

$$SBRA = (Daily\ Rounding\ Residual \times Database\ Processing\ Interval) / Macro\ Batch\ Run\ Units$$

3. IMPLEMENTATION ENGINEERING GUIDELINES

When writing these math formulas into Siebel eScript or integrating via data layers like Power BI dashboards, engineers must enforce the following validation checkpoints:

- **Null Pointer Prevention:** The variable `Number of Periods` or equivalent index terms must always pass a validation check ensuring values are greater than zero to eliminate structural divide-by-zero crashes.
- **Data Serialization Standards:** Values map to `Number` data types within the Integration Object layer, using explicit floating-point execution variables.
