

Siebel CRM Public Sector Rule Matrix

Base Architecture: $OGM = (\text{Daily Liability} * \text{Number of Days}) / \text{Number of Periods}$

Constraint: All daily liability variables are rounded to 2 decimal places prior to execution.

This document outlines 20 derived functional specifications for extended calculation and enforcement rules based on the provided reference logic.

1. Adjusted Gross Liability (AGL)

$$AGL = ((\text{Daily Liability} + \text{Daily Surcharge}) * \text{Number of Days}) / \text{Number of Periods}$$

Calculates the total gross liability including daily applied surcharges across the active periods.

2. Net Period Collection (NPC)

$$NPC = (\text{Daily Liability} * \text{Number of Days} * \text{Collection Rate}) / \text{Number of Periods}$$

Adjusts the expected collection by a historical success rate to forecast actual revenues.

3. Prorated Monthly Arrears (PMA)

$$\text{PMA} = (\text{Past Due Liability} * \text{Days in Month}) / 30$$

Standardizes arrears into a strict 30-day monthly tracking window for reporting.

4. Daily Interest Surcharge (DIS)

$$\text{DIS} = (\text{Daily Liability} * \text{Annual Interest Rate}) / 365$$

Calculates the exact daily interest applied to outstanding balances.

5. Compound Penalty Factor (CPF)

$$\text{CPF} = \text{Daily Liability} * (1 + \text{Penalty Rate})^{\text{Periods}}$$

Applies compounding period-over-period penalties to the base liability.

6. Effective Daily Rate (EDR)

$$\text{EDR} = \text{Total Period Liability} / \text{Days Active}$$

Reverse calculates the true daily cost from a fixed period assessment.

7. Period Overpayment Recovery (POR)

$$\text{POR} = (\text{Overpayment Amount} / \text{Total Days}) * \text{Recovery Periods}$$

Spreads clawback recoveries evenly over future billing cycles.

8. Subsistence Income Allowance (SIA)

$$\text{SIA} = (\text{Protected Income} * \text{Number of Days}) / \text{Number of Periods}$$

Calculates the floor income protected from enforcement deductions.

9. Hardship Adjusted Liability (HAL)

$$\text{HAL} = ((\text{Daily Liability} - \text{Relief Discount}) * \text{Number of Days}) / \text{Number of Periods}$$

Reduces operational liability due to verified medical or economic hardship.

10. Delinquency Escalation Fee (DEF)

$$\text{DEF} = (\text{Daily Liability} * \text{Days Delinquent}) * \text{Tier Multiplier}$$

Applies a multiplier based on how long the debt has been delinquent in the system.

11. Standard Base Assessment (SBA)

$$\text{SBA} = (\text{Verified Gross Income} * \text{Assessment \%}) / \text{Number of Periods}$$

Calculates baseline capability before formal liability assignment.

12. Seasonal Variation Adjustment (SVA)

$$\text{SVA} = \text{Daily Liability} * \text{Seasonal Index Factor}$$

Adjusts daily obligations for obligors with highly seasonal employment.

13. Total Accrued Maintenance (TAM)

$$\text{TAM} = \text{Sum}(\text{Daily Liability} * \text{Days Active}) \text{ across all periods}$$

Aggregates all historical debts into a single master balance.

14. Weekly Liability Conversion (WLC)

$$\text{WLC} = (\text{Daily Liability} * 7)$$

Converts the standard daily atomic unit into a weekly billing cycle for payroll.

15. Shared Care Reduction (SCR)

$$\text{SCR} = \text{Daily Liability} * (1 - (\text{Nights Shared} / \text{Total Nights}))$$

Reduces liability based on the percentage of nights the child is hosted by the non-resident parent.

16. Asset Imputed Income (AII)

$$AII = (\text{Total Capital Assets} * \text{Statutory Yield}) / 365$$

Generates a synthetic daily liability derived from illiquid capital wealth.

17. Third-Party Deduction Levy (TDL)

$$TDL = ((\text{Daily Liability} * \text{Number of Days}) / \text{Periods}) * \text{Employer Handling Fee} \%$$

Calculates the fee passed to employers processing wage garnishments.

18. Arrears Repayment Threshold (ART)

$$ART = (\text{Total Arrears} / \text{Maximum Recovery Periods}) + \text{Daily Liability}$$

Defines the maximum legal threshold for combined ongoing and arrears collections.

19. Minimum Collection Quantum (MCQ)

$$MCQ = \text{Statutory Minimum} * \text{Days in Period}$$

Enforces a hard floor on collection activities regardless of income drops.

20. Terminal Settlement Balance (TSB)

$$\text{TSB} = \text{TAM} - \text{Sum}(\text{Historical Recoveries}) + \text{Early Settlement Penalty}$$

Calculates the final payoff quote for closing a multi-period enforcement case.
